

**Please write at least 50 characters about what you learned in today's lecture**

What I learned from today's final session is that there is no need to be an AI superpower as big as Silicon Valley; Rather, the real AI revolution for a country like Bangladesh lies in solving our own and local problems. From the panel discussion, I learned how to combine domain knowledge and AI tools to create new startups or business prospects. In addition, the practical examples of Zimbabwe's offline-first and WhatsApp-based AI solutions and Bangladesh's 'Shiko' app show that understanding the true needs and limitations of the user is the first condition for successful innovation.

**Please tell us specifically what you found particularly helpful in today's lecture**

What I liked the most was the experience of Tafadzwa, the co-founder of the African startup 'Affinity Technologies'. In a country like Zimbabwe, where the internet is slow and data consumption is high, how they have made the offline-first model and the popular 'WhatsApp' a medium to create customer service and education tools for low-resource languages is truly eye-opening. This case study has shown that the limitations of technology are actually the best map to create something new. In addition, Dr. Sadiar remembers the saying that no matter how many no-code or AI tools come up, in the end, basic or fundamental knowledge like mathematics and science will sustain a skilled engineer.

**Please let us know if there were any parts that were unclear or if there are any areas for improvement**

The whole event was very organized and interesting. However, the part of the physical AI and control system that Renner (Lensan) discussed in the session was a bit complicated. Since this is a very new and promising field, it would have been easier to understand if there had been a simpler example or diagram on the slide about the practical application of physical AI or how it works with data in general robotics.

**Please tell us specifically about the instructor, including what you liked and what you were dissatisfied with**

The moderator Takashi Wabuchi and the moderator of BRAC University conducted the session very lively, which did not result in fatigue even after sitting for a long time. Professor Matsuo's video message and GCI alumni Sarumuro's career guidelines were very timely and inspiring. I didn't find anything to be dissatisfied with, but this effort to engage the panelists, both online and offline, was outstanding.

**Please write down any lectures or subjects you would like to see offered in the future**

In the future, I would like to see a lecture or course on "AI Agents in Everyday Workflows" especially how to integrate custom AI into WhatsApp or messaging apps and "Physical AI and Edge Robotics for Developing Countries".

This program from GCI World for the past 3 months has been one of the best learning experiences of my life. Many thanks to Matsuo Lab, JICA and BRAC University for designing such an excellent course on learning coding as well as how to apply it socially or practically in business. Many congratulations to all the winners and winners of the hackathon!
