

Write in at least 50 characters about what you learned from today's lecture.

Today's lecture goes beyond technical discussions and focuses on the practical aspects of being a business and an entrepreneur. As a student at Systems Innovation at the University of Tokyo, Shudai Komoria started BAKUTAN Inc. with the help of Matsuo Lab Ecosystems. The story of the establishment was very instructive. He elaborated on how data science and custom AI-ERP technology can help eliminate various inefficiencies and mismatches in the traditional HR sector. On the other hand, through Yuki Ishida, Group CEO of YCP Holdings, I understood real-world global consulting and the practical transformations of AI in e-commerce, the public sector and retail business. We've got a clear roadmap for how AI is creating new job types and career opportunities.

What did you find particularly helpful in today's lecture?

I like one of Shudai Komoria's advice best to become an entrepreneur. We need to identify real-world organizational problems and create data-driven solutions. This experience from Professor Matsuo and other mentors has changed my own thinking. In addition, when Yuki Ishida gave an example of how cheap and easy AI transformation and POS development has become today due to open source or recent generative AI tools, it has increased my courage to start a startup.

Was there any part that was ambiguous, or do you think there is room for improvement?

Overall, the session was excellent. However, due to time constraints, the speakers had to skip some important business case studies on the slide quite quickly. The data density on the slides was very high. For such excellent and practical lectures in the future, if the discussion time can be increased with a little increased emphasis on interactive Q&A, it will be very fruitful.

Give your opinion about the instructors (guest speakers) (what you liked and disliked if any)

Both speakers were unique and excellent. As Shudai Komoria is so close to us, I was able to relate to her struggles to become an entrepreneur, sleepless nights, and the challenges of handling data security. Again, Yuki Ishida, being very experienced, explains the future of the global market and consulting very nicely.

What other types of lectures or subjects would you like to attend in the future?

I would like to see a dedicated session or case study on fundraising, creating an initial pitch deck for AI startups in the future, and the practical application of AI ethics, governance and international data privacy laws to new AI products.

Write your valuable opinion or comments here

Thank you for coming to the end of the GCI course and organizing such practical business sessions along with technical education. It has motivated the theoretical knowledge we have learned into practical applications. I am also grateful to the organizers for giving me the opportunity to give late submission of the final assignment! I am eagerly waiting to participate in the Session 14 Hackathon.
