

[Required] Please enter what you learned from today's lecture in at least 30 words.

I learned how to use the pandas library to clean and preprocess tabular data. We covered the foundational differences between 1D Series and 2D DataFrame objects, how to extract data using loc and iloc, and how to identify and handle missing values using methods like isnull() and listwise deletion via dropna. I also learned how to combine multiple datasets using merge (inner/outer joins) and concat, and how to bin continuous numerical data using the cut and qcut functions. Working through the actual MyAnimeList database made these abstract concepts much easier to understand and apply practically.

(Optional) Please provide specific details about what you particularly liked about today's lecture.

I particularly liked the clear, visual ways that complex pandas concepts were summarized. Specifically, the summary slide that organized data extraction methods (loc, iloc, at, iat) onto a two-axis grid comparing full dataframe vs. single element retrieval, and label-based vs. integer-based indexing was a massive help for my understanding. I also really appreciated the visual slides used to explain the different types of data merging, making the distinction between inner joins and outer joins incredibly easy to grasp. Finally, the dynamic format of constantly switching back and forth between the lecture video and hands-on Colab exercises kept the pacing exciting and allowed us to immediately practice what we just learned on the real-world MyAnimeList dataset.

(Optional) If there were any parts that were unclear or areas for improvement, please provide specific details.

The differences between cut and qcut and how they handle bins (equal intervals vs. equal counts) was a little tricky to visualize at first, though the 100-random-number histogram examples definitely helped. Maybe spending a tiny bit more time on the advanced hierarchical grouping would be nice!

(Optional) Regarding the instructor, please provide specific details about what you liked or disliked.

I really liked how Instructor Suanaka-san gave us a few minutes to solve the practice questions on our own and then carefully explained her solution code step-by-step. Her specific explanation of setting right=False to make the right side an open interval in the cut function was super helpful for Practice Question 3-5.

(Optional) Please write down any lectures or fields you would like to attend in the future.

I am really looking forward to Session 4, where we will learn about data visualization using matplotlib, so I can finally plot the data we just learned how to clean.

(Optional) Please feel free to write any other comments or opinions.

Thanks for a great session. Using the anime dataset and predicting scores made the hands-on coding practice very relatable and engaging.
