

Please enter what you learned from today's lecture in at least 30 words.

I learned how to perform Exploratory Data Analysis (EDA) using Python libraries like Matplotlib and Seaborn. We went through a practical case study using a bike-sharing dataset to build line plots, histograms, scatter plots, and heatmaps. I also learned how to properly format graphs with titles and axes, and how to use Seaborn's 'hue' parameter to compare different categories easily without manually shifting bars.

Please provide specific details about what you particularly liked about today's lecture.

I really appreciated the business case study approach using the bike rentals. Visualizing real factors like how temperature, seasons, and working days impact casual versus registered users made the coding concepts much more practical and easier to grasp.

If there were any parts that were unclear or areas for improvement, please provide specific details.

The section on calculating correlation coefficients and generating the heatmap went by a bit fast. It would be helpful to spend slightly more time explaining the statistical concepts of covariance and standard deviation before jumping into the seaborn heatmap code.

Regarding the instructor, please provide specific details about what you liked or disliked.

Sarifuro was an engaging and clear lecturer. I specifically liked that he took the time during the Q&A to explain how to handle missing data when plotting in Matplotlib, outlining helpful options like dropna, fillna, and interpolate.

Please write down any lectures or fields you would like to attend in the future.

I am really looking forward to Session 5, where we will transition from basic data manipulation to supervised machine learning.

Please feel free to write any other comments or opinions.

Thank you for the great session. The reminders about the upcoming Final Assignment and the Session 7 in-class tutorial were very helpful for planning my schedule.
