

Please enter what you learned from today's lecture in at least 30 words.

Today, I learned the detailed requirements for the upcoming competition and the final assignment. For the competition, our task is to build a predictive model for the NFL draft, and we were strictly reminded not to use external data or hand-label the dataset. For the final assignment, we need to create a business proposal based on a telecom company's data and present it in a way that non-technical executives can easily understand. Aki's walkthrough of the baseline notebook was also really helpful for getting started.

Please provide specific details about what you particularly liked about today's lecture.

I really appreciated the detailed breakdown of what is expected for the final assignment's business proposal. It was particularly helpful when Aki emphasized that a machine learning model isn't the final solution on its own, and that we need to connect our model's insights to actual business outcomes, such as potential revenue lift, cost savings, or risks. I also really liked the Q&A session at the end, getting advanced tips on how to handle missing values, like grouping data by other features or using linear regression instead of just filling everything with the mean, was incredibly practical.

If there were any parts that were unclear or areas for improvement, please provide specific details.

The audio was quite muffled because the recording took place in a large auditorium, which made it a little hard to follow at times. However, the subtitles you provided were very helpful. I hope the audio recording setup is improved for the next on-site session in Session 14.

Regarding the instructor, please provide specific details about what you liked or disliked.

I really liked how Aki took the time to do a live code walkthrough of the baseline models and demonstrated how to apply a log transformation to handle right-skewed data like the agility scores. It made the theoretical concepts much easier to grasp.

Please write down any lectures or fields you would like to attend in the future.

I would love to learn more about unsupervised learning techniques that were briefly mentioned during the Q&A and how to apply them to our final assignment to gain better insights.

Please feel free to write any other comments or opinions.

Congratulations to the UP Diliman students for their high retention rate and for hosting the hybrid session. The hackathon looked like a lot of fun.

How did today's on-site lecture affect your motivation toward the remaining lectures of GCI World?

Watching the recap of the UP Diliman students participating in the hackathon was really inspiring. It definitely motivated me to keep my attendance and homework scores up so that I might have a chance to get selected for the next on-site visit in Session 14.
