

Please enter what you learned from today's lecture in at least 30 words

I finally understood the difference between precision and recall, and why accuracy isn't always the best metric, especially for imbalanced data like the disease diagnosis example we discussed. The hands-on Google Colab part with the breast cancer dataset really helped me grasp how to use the confusion matrix and plot the ROC curve using scikit-learn.

Please provide specific details about what you particularly liked about today's lecture

I really liked how the lecture connected the theoretical metrics to real-world scenarios. The practical summary of when to use which metric like recall for cancer screening, where missed detections are risky, and precision for spam detection, where false positives are costly made the concepts much easier to grasp. Additionally, the step-by-step visual breakdown of how the ROC curve is drawn by sweeping the threshold from 0 to 1 was incredibly helpful for visualizing what is actually happening under the hood.

If there were any parts that were unclear or areas for improvement, please provide specific details

Practice question 6-2 involving the multi-class classification with the OneVsRestClassifier for the Iris dataset was definitely a bit tricky for me to wrap my head around. I think I'll need to review the notebook and the scikit-learn documentation for that part again to fully get it.

Regarding the instructor, please provide specific details about what you liked or disliked

I thought Taii Watanabe explained the concepts very clearly, especially the step-by-step visual breakdown of how the ROC curve is drawn by sweeping the threshold. I also really appreciated that he took the time to do a live Q&A session to clarify our doubts.

Please write down any lectures or fields you would like to attend in the future.

Since we have mostly covered supervised learning so far, I'm really looking forward to the upcoming lectures on unsupervised learning. I would also love to see some practical deep learning topics if possible.

Please feel free to write any other comments or opinions

Thanks for the great lecture. I'm really looking forward to the upcoming hybrid session and the one-day hackathon.
